

Mailutil

The "mailutil" command is used to manage server-side related configuration (e.g., mailboxes, proof-of-work difficulty , etc)

The mailutil command houses various subcommands which are listed below:

"mailbox" subcommand:

"create" [NAME]:

Create a new mailbox

Example: "mailbox create foo"

"list":

List available mailboxes

Example: "mailbox list"

"rm" [NAME]"

Delete a specified mailbox

Example: "mailbox rm foo"
